

WHAT CLICKS DOES — IN ONE FLOW

One contract call. **Deterministic split.** Every party attributable on-chain. We don't operate vaults — we route flow into audited 3rd-party ERC-4626. *Smaller surface = more composable.*

THE WEDGE

19 % of on-chain activity is now AI-agent-driven. 100 % of their USDC sits idle by default.

- Every agent-builder reimplements: fee split, attribution, idle-USDC-to-vault.
- Clicks is the missing primitive — drop-in, one call site.
- No new chain. No new token. No vault custody.

SDK — DROP-IN, 3 LINES

```
import { ClicksClient } from "@clicks-protocol/sdk";
const clicks = new ClicksClient({ chain: "base", signer });
await clicks.splitAndRoute({ amountUsdc, ops: 0.8, yield: 0.2 });
```
